INTRODUCTION

The subdivision plan for Oakland Hills on Bardstown Road in Louisville, KY shows 592 single family lots with a tract for multi-family of 348 units. Access to the subdivision will be from Bardstown Road and Broad Run Parkway. The original plan for this development had 736 single family lots with access only from Bardstown Road. **Figure 1** displays a map of the site. The purpose of this study is to examine the traffic impacts of the development upon the adjacent highway system. For this study, the impact area was defined to be the intersections of Bardstown Road with Oakland Hills Trail and Broad Run Parkway.

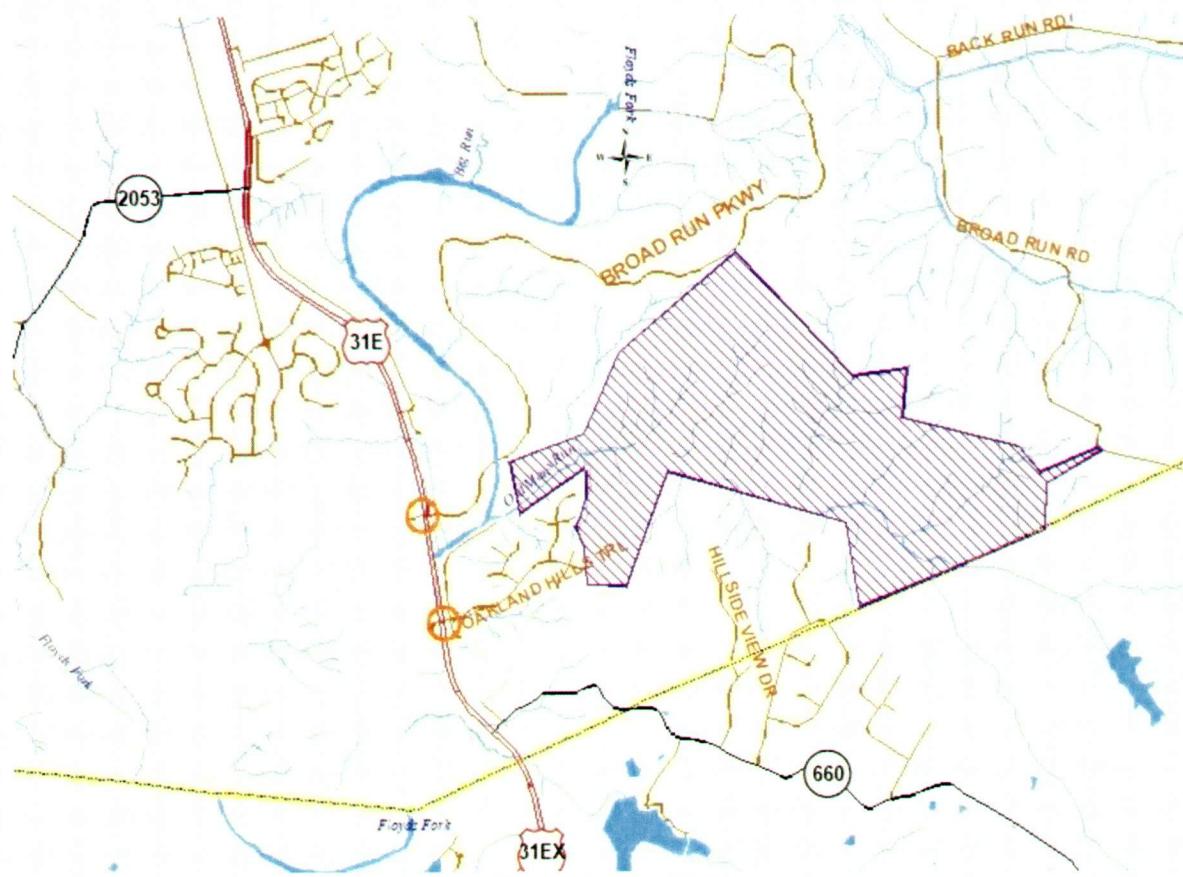

Figure 1. Site Map

EXISTING CONDITIONS

Bardstown Road, US 31E, is maintained by the Kentucky Transportation Cabinet (KYTC) with an estimated 2018 Average Daily Traffic (ADT) volume of 35,100 vehicles per day between the Bullitt County line and Thixton Lane (KY 2053), as estimated from the KYTC 2013 count at station 257. The road is a four-lane highway with twelve-foot lanes, a depressed 32 foot median and ten-foot paved shoulders. The speed limit is 55 mph. There are no sidewalks. The intersection with Oakland Hills Trail has dedicated left turn lanes and is controlled with a stop sign on Oakland Hills Trail. The intersection with Broad Run Parkway has dedicated left turn lanes on all approaches and is controlled with a traffic signal.

Oakland Hills
Traffic Impact Study

A.m. and p.m. peak hour traffic counts were collected on January 10, and 31, 2018 (see Appendix A). The a.m. peak hour occurred between 7:00 and 8:00 a.m. and the p.m. peak hour occurred between 5:00 and 6:00 p.m. Figure 2 illustrates the existing a.m. and p.m. peak hour traffic volumes.

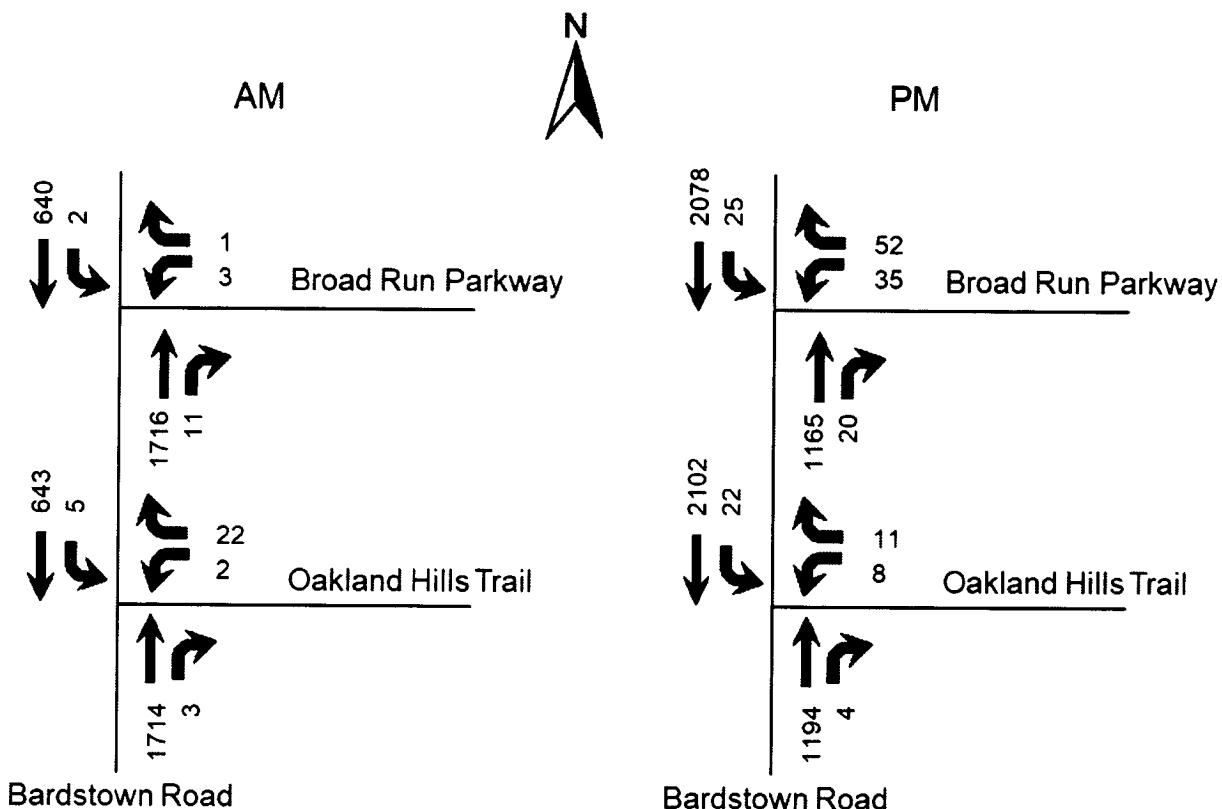

Figure 2. Existing Peak Hour Volumes

FUTURE CONDITIONS

The project completion date is 2030. An annual growth rate of 1.0 percent was applied to Bardstown Road and the park volumes. This is based upon historical growth at KYTC station C39 on US 31E in Bullitt County. The No Build volumes include full build-out of the original 736 lots. 57 lots currently have homes, so there are 679 remaining lots. The trip generation results are listed in Table 1. Figure 3 displays the 2030 No Build peak hour volumes.

Table 1. Peak Hour Trips Generated by Original Plan

Land Use	A.M. Peak Hour			P.M. Peak Hour

TRIP GENERATION

The Institute of Transportation Engineers Trip Generation Manual, 10th Edition contains trip generation rates for a wide range of developments. The land uses of "Single-Family Detached (210)" and "Multifamily Housing (Mid-Rise) (221)" were reviewed and determined to be the best match. The trip generation results are listed in **Table 2**. The trips were assigned to the highway network with the percentages shown in **Figure 4**. **Figure 5** shows the trips generated by this development and distributed throughout the road network during the peak hours. **Figure 6** displays the individual turning movements for the peak hours when the development is completed.

Table 2. Peak Hour Trips Generated by Site

Land Use	A.M. Peak Hour			P.M. Peak Hour		
	Trips	In	Out	Trips	In	Out
Single-Family Detached (592 lots)	425	106	319	560	353	207
Multifamily (Mid-Rise) (348 units)	116	30	86	147	89	58
TOTAL	541	136	405	707	442	265

ANALYSIS

The qualitative measure of operation for a roadway facility or intersection is evaluated by assigning a "Level of Service". Level of Service is a ranking scale from A through F, "A" is the best operating condition and "F" is the worst. Level of Service results depend upon the facility that is analyzed. In this case, the Level of Service is based upon the total delay experienced at an intersection.

To evaluate the impact of the proposed development, the vehicle delays at the intersections were determined using procedures detailed in the Highway Capacity Manual, 6th edition. Future delays and Level of Service were determined for the intersections using the HCS Streets (version 7.4) software. The delays and Level of Service are summarized in Table 3.

Table 3. Peak Hour Level of Service

Approach	A.M.			P.M.		
	2018 Existing	2030 No Build	2030 Build	2018 Existing	2030 No Build	2030 Build
Bardstown Road at Oakland Hills Trail						
Oakland Hills Trail Westbound	C 20.5	F 252.9	C 18.0	C 23.8	F 174.8	C 21.2
Bardstown Road Southbound (left)	C 18.1	D 37.2	D 30.6	B 11.9	D 26.9	C 21.5
Bardstown Road at Broad Run Parkway	A 2.5	A 3.8	A 8.1	A 6.0	B 12.6	B 13.8
Broad Run Parkway Westbound	D 43.2	E 60.3	E 55.3	D 49.6	E 56.3	E 57.3
Bardstown Road Northbound	A 2.8	A 4.6	A 7.7	A 3.1	A 3.5	A 4.0
Bardstown Road Southbound	A 1.7	A 1.4	A 4.0	A 5.8	B 16.2	B 16.7

Key: Level of Service, Delay in seconds per vehicle

The Oakland Hills Trail intersection was evaluated for turn lanes using the Kentucky Transportation Cabinet Highway Design Guidance Manual dated March, 2017. Using the volumes in Figure 5, a northbound right turn lane will be required on Bardstown Road at the Oakland Hills Trail intersection.

CONCLUSIONS

Based upon the volume of traffic generated by the development and the amount of traffic forecasted for the year 2030, there will be a manageable impact to the existing highway network, with Levels of Service remaining within acceptable limits. A northbound right turn lane is required on Bardstown Road at the Oakland Hills Trail intersection. The proposed plan improves the traffic operations as compared to the existing plan for the site. The improvement is due to the access to the park road system, especially the signal at Broad Run Parkway intersection with Bardstown Road.

MEMO

RE: Pitch and Concourse Elevation Investigation

As requested, HOK is providing this memo to investigate lowering the pitch and concourse elevations to aid in understanding the potential savings in fill material.

The design team arrived at the current pitch (444.0') and concourse (453.0') elevations with the knowledge of the 100-year floodplain (449.8') and using Slugger Field (approximately 443.5') as a local precedent. It is HOK's understanding that Slugger Field has not been adversely affected by flood waters since its construction.

The relationship between the pitch and concourse elevations are a result of the seating bowl capacity and sight lines, among others. The pitch, concourse and seating bowl should be thought of as a system. This system can move as a whole.

With the pitch elevation at 444.0' the subsurface drainage invert elevation is assumed to be 438.50'. The invert shown on the field subdrainage plan (see sheet PF 1-2) that ties into the storm sewer manhole (see MSD plans) is well above the high water table elevation of 420'. We suggest installing a back water valve at this location in the event that water table does exceed 420'. The fields' subdrainage piping system can also intercept rising water table, and hold for a time in the piping and gravel layer until the water recedes.

With this knowledge, HOK does not oppose investigating the saving to be had in fill material with lowering the pitch and concourse elevations.

The options, in 6" increments are the following:

RECEIVED

MAR 08 2018

PLANNING & DESIGN SERVICES

Option A: Lower by 0.5'

Pitch - 443.5'

Concourse - 452.5'

Option B: Lower by 1.0'

Pitch - 443.0'

Concourse - 452.0'

Option C: Lower by 1.5'

Pitch - 442.5'

Concourse - 451.5'

All options keep the con-

While the field tunne

All options keep the concourse above the 100-year floodplain elevation.

While the field tunnel, dock and service yard are lower than the 100-year flood elevation, this areas is protected by elevations above the 100-year flood elevation.

At this time, these options do not appear to require any significant structural modifications.
